Expression of growth/differentiation factor 11, a new member of the BMP/TGPbeta superfamily during mouse embryogenesis.";
Mech. Dev. 80:185-189(199).
-!- FUNCTION: SECRETED SIGNAL THAT ACTS GLOBALLY TO SPECIFY POSITIONAL IDENTITY ALONG THE ANTERIOR/POSTERIOR AXIS DURING BEVELOPMENT.
PLAY CRITICAL ROLES IN PATTERNING BOTH MESODERMAL AND NEURAL.
TISSUES AND IN ESTABLISHING THE SKELETAL PATTERN (BY SIMILARITY).
-!- SUBGUNIT: HOWODIMER, DISULFIDE-LINKED (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: SECRETED (PROBABLE).

SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Biochem. Biophys. Res. Commun. 206:608-613(1995).

-1- FUNCTION: INHIBINS ARE GONADAL GLYCOPEPTIDES THAT INHIBIT THE SECRETION OF FOLLITROPIN BY THE PITUITARY GLAND. ON THE OTHER HAND ACTIVINS ACTIVATE THE SECRETION OF FOLLITROPIN. ACTIVINS REGULATE GROWTH AND DIFFERRITIATION OF BENBRYONAL CARCINOMA CELLS, INDUCE ERYTHROPOIESIS, STIMULATE INSULIN SECRETION, AND PROMOTE NEURAL CELL SURVIVAL. ACTIVINS ARE ALSO IMPORTANT IN EMBRYONIC AXIAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   355 NSDWQCKRKNLFVNF-EDLDWQEWIIAPLGYVAFYCQGECAFPLNGHANATNHAIVQTLV 413

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         "Molecular evolution at the decapentaplegic locus in Drosophila.";
Genetics 145:297-309(1997).

-!- FUNCTION: ACTS AS AN EXTRACELLULAR MORPHOGEN TO ESTABLISH AT LEAST
TWO CELLULAR RESPONSE THRESHOLDS WITHIN THE DORSAL HALF OF THE
DROSOPHILA EMBRYO. REQUIRED FOR THE PROPER DEVELOPMENT OF THE
EMBRYONIC DORSAL HYPODERM, FOR VIABILITY OF LARVAE AND FOR CELL
VIABILITY OF THE EPITHELIAL CELLS IN THE IMAGINAL DISKS. ACTS
TOGETHER WITH SCW (BY SIMILARITY).

-!- SUBUNIT: HETERODIMERS OF SCW/DPP ARE THE ACTIVE SUBUNIT, DPP/DPP
                                                                                                                                                                                                                                                               Drosophila simulans (Fruit fly).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HOMODIMERS ELICIT A BASAL RESPONSE AND SCW/SCW HOMODIMERS ALONE ARE INEFFECTIVE IN SPECIFYING A DORSAL PATTERN (BY SIMILARITY). TISSUE SPECIFICITY: EXPRESSED IN THE IMAGINAL DISCS ASSOCIATED WITH ESTABLISHMENT OF THE PROXIMAL-DISTAL AXIS OF THE APPENDAGES, AND MIDGUT MESODERN (BY SIMILARITY). SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Newfeld S.J., Padgett R.W., Findley S.D., Richter B.G., Sanicola M., de Cuevas M., Gelbart W.M.;

Than of C., Hogan B.L.;

Evidence that mouse Bmp8a (Op2) and Bmp8b are duplicated genes that play a role in spermatogenesis and placental development.";

Mech. Dev. 57:159-168[1986].

C -1- FUNCTION: INDUCES CARTILAGE AND BONE FORMATION MAY BE THE OSTEOINNUCTIVE FACTOR RESPONSIBLE FOR THE PHENOMENON OF EPITHELIAL OSTEOENESIS. PLAYS A ROLE IN CALCIUM REGULATION AND BONE HOMBOSTAGIS (BY SIMILARITY).

C -1- SUBDUTT: HOMODIMER, DISCLETIDE-LINKED.

C -1- SUBCELLULAR LOCATION: SECRETED (BY SIMILARITY).

C -1- SUBCELLULAR LOCATION: STREET TOF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R HSSP; P18075; IBMP.

Amphibia; Batrachia; Anura; Mesobatrachia; Pipoidea; Pipidae;
FUNCTION: INDUCES CARTILAGE AND BONE FORMATION. MAY BE THE OSTEDINDUCTIVE FACTOR RESPONSIBLE FOR THE PHENOMENON OF EPITHELIAL OSTEOGRNESIS. PLAYS A ROLE IN CALCIUM REGULATION AND BONE HOMEOSTASIS (BY SIMILARITY). SUBJUNT: HOMODIMER, DISGULFIDE-LINKED. SUBJULIAR LOCATION: SECRETED. SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             InterPro; IPRU01400, 1976-beta; 1.

Jones C.M., Simon-Chazottes D., Guenet J.-L., Hogan B.L.;

Jeolation of Vgr-2, a novel member of the transforming growth
factor-beta-related gene family,";

Mol. Endocrinol. 6:1961-1968(1992).

I- SUBONIT: HOMODIMER OR HETERODIMER (POTENTIAL). BUT, IN CONTRAST
TO OTHER MEMBERS OF THIS FAMILY, CAN NOT BE DISULFIDE-LINKED.

I- SUBCELLULAR LOCATION: SECRETED (PROBABLE).

I- TISSUE SPECIFICITY: PRIMARILY IN ADULT BONE MARROW, SPLEEN, THYMUS
AND ADIPOSE TISSUE.

I- SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

PROLIFERATION, DIFFERENTIATION, AND OTHER FUNCTIONS IN MANY CELL TYPES. MANY CELLS SYNTHESIZE TGF-BETA I AND ESSENTIALLY ALL OF THEM HAVE SPECIFIC RECEPTORS FOR THIS PEPTIDE. TGF-BETA I REGULATES THE ACTIONS OF MANY OTHER PEPTIDE GROWTH FACTORS AND DETERMINES A POSITIVE OR NIGATIVE DIRECTION OF THEIR EFFECTS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

FISH SHELL RELY TO BE AN IMPORTANT CYTOKINE REGULATING IMMUNE RESPONSE. MAY ALSO HAVE A ROLE IN OTHER PHYSIOLOGICAL SYSTEMS.

FISHER SPECIATY. HIGHER LEVELS FOUND IN MONDUCLEAR CELLS FROM PERIPHERAL BLOOD THAN IN SPECIA FOUND IN MONDUCLEAR CELLS FROM PERIPHERAL BLOOD THAN IN SPECIA PANILY.

FIRST POLITY: BELONGS TO THE TGF-BETA FAMILY.
